

NQ and ES: passing a 50K prop eval in five days

NQ: 2 of 5 setups meet the 60% test on the 2025+ holdout (Lucid Flex, Pro no DLL), but only if Lucid counts closed balance: under open-loss breach they drop to 20% or less. **ES:** 0 of 5 setups meet the 60% test on the 2025+ holdout (none).

NQ holdout scored independently verified files as of 2026-10-01 02:32 **ES** holdout scored independently verified files as of 2026-10-01 16:51

01 Verdict

Can a strategy pass a 50K eval within 5 trading days at least 60% of the time? The test is run three ways: on the search data, on a walk-forward, and on 2025+ data that was never used to choose anything.

► Terms in one line each

NQ (E-MINI NASDAQ-100)

The 60% test: P(pass the eval within 5 trading days) ≥ 60%

Firm	In-sample	Walk-forward OOS	2025+ holdout	Best finalist in holdout (picked after scoring)	Verdict
Lucid Flex	69% PASS	65% PASS, CI < 60%	78% PASS	78% PASS	PASS if closed balance counts
Pro + DLL	45% FAIL	43% FAIL †	28% FAIL	41% FAIL	FAIL
Pro no DLL	71% PASS	66% PASS	81% PASS	81% PASS	PASS if closed balance counts
Apex user set UNCONFIRMED	41% FAIL	33% FAIL	33% FAIL	43% FAIL	FAIL
Apex EOD site UNCONFIRMED	42% FAIL	36% FAIL	27% FAIL	35% FAIL	FAIL

Walk-forward OOS = offline quarterly re-pick of cell and daily rules on the same family, timeframe and session. † Pro + DLL: no re-pick row exists, so the fixed-parameter walk-forward is shown.

How fast: P(pass by day 1, 2, 3, 5), bust within 5 days, cost per funded account

Firm	Stage	By day 1	By day 2	By day 3	By day 5	Bust ≤ 5d	Cost per funded
Lucid Flex	In-sample	0%	0%	66%	69%	31%	\$145
	Holdout	0%	0%	75%	78%	22%	\$128
Pro + DLL	In-sample	24%	38%	42%	45%	54%	\$257
	Holdout	15%	25%	27%	28%	72%	\$418
Pro no DLL	In-sample	67%	70%	71%	71%	29%	\$198
	Holdout	79%	81%	81%	81%	19%	\$172
Apex user set UNCONFIRMED	In-sample	24%	38%	40%	41%	59%	\$170
	Holdout	20%	33%	33%	33%	67%	\$190

	Holdout	14%	23%	25%	27%	73%	\$217

Cost per funded account = eval fee ÷ P(pass in 5 days) + activation fee. It assumes you abandon an eval after 5 days and buy a new one. Fees are assumptions (Lucid Pro prices from you; Flex and Apex assumed).

Recommended setup per firm

Lucid Flex 50K	Eval: straddle 30m, NY AM, 40 micros (cell #10). Daily rules: lock \$750 · take \$1,500 · stop at target. Funded: straddle 30m, NY PM, 40 micros (cell #32). Daily rules: lock \$300 · take \$600 · payout at ≥\$1,500.
LucidPro 50K with \$1,200 daily limit	Eval: tod_drift 15m, Midday, 30 micros (cell #19). Daily rules: lock \$1,000 · stop at target. Funded: donchian 15m, NY PM, 30 micros (cell #10). Daily rules: lock \$600 · payout at ≥\$1,500.
LucidPro 50K, no daily limit	Eval: straddle 30m, NY AM, 40 micros (cell #10). Daily rules: lock \$1,000 · stop at target. Funded: orb 5m, Midday, 40 micros (cell #10). Daily rules: lock \$300 · take \$1,000 · payout at ≥\$1,000.
Apex user rule set (Legacy label) UNCONFIRMED	Eval: rsi2 1m, Midday, 40 micros (cell #9). Daily rules: day-stop \$1,000 · stop at target. Funded: donchian 15m, NY AM, 30 micros (cell #1). Daily rules: lock \$1,000 · take \$1,000 · payout at ≥\$1,000.
Apex EOD site rule set UNCONFIRMED	Eval: donchian 5m, NY PM, 30 micros (cell #5). Daily rules: stop at target. Funded: No funded model for this rule set.

Key risk: does Lucid break an account on the closed balance or on open losses?

Every Lucid number in this report assumes the account is lost only when the **closed (realised) balance** reaches the Max Loss Limit. Lucid's pages say “account balance reached the MLL” and do not say whether a floating loss counts. If open losses count (the Apex rule), the same strategies almost never reach the target. Both numbers, same strategy:

Lucid product	Eval P5 closed: in-sample	closed: holdout	Eval P5 open P&L: in-sample	open P&L: holdout	Funded E\$40 closed: in-sample	open P&L: in-sample	closed: holdout	open P&L: holdout
Lucid Flex	69%	78%	1.0%	2.1%	\$3,330	\$41	\$2,488	\$0
Pro + DLL	45%	28%	40%	25%	\$1,996	\$1,520	\$1,252	\$1,134
Pro no DLL	71%	81%	23%	20%	\$5,426	\$22	\$4,824	\$17

Why: the winning structures use wide stops (about 3 ATR) at 30 to 40 micros, so a single trade can float far below the limit and recover. A closed-balance rule never sees that dip. **Ask Lucid support in writing before sizing up.**

ES (E-MINI S&P 500)

The 60% test: P(pass the eval within 5 trading days) ≥ 60%

Daily rules: lock \$300 · day-stop \$1,000 · max 1 trade/day · payout at ≥\$500. NOT COMPLIANT with Apex PA rules: mae750_share_0.82_NONCOMPLIANT
Apex EOD site rule set UNCONFIRMED	Eval: donchian 5m, NY PM, 60 micros. Daily rules: stop at target. Funded: No funded model for this rule set. NOT COMPLIANT with Apex PA rules: mae750_share_0.83_NONCOMPLIANT

Key risk: does Lucid break an account on the closed balance or on open losses?

Every Lucid number in this report assumes the account is lost only when the **closed (realised) balance** reaches the Max Loss Limit. Lucid's pages say “account balance reached the MLL” and do not say whether a floating loss counts. If open losses count (the Apex rule), the same strategies almost never reach the target. Both numbers, same strategy:

Lucid product	Eval P5 closed: in-sample	closed: holdout	Eval P5 open P&L: in-sample	open P&L: holdout	Funded E\$40 closed: in-sample	open P&L: in-sample	closed: holdout	open P&L: holdout
Lucid Flex	49%	56%	14%	13%	\$1,618	\$542	\$1,080	\$97
Pro + DLL	41%	32%	36%	29%	\$2,093	\$1,108	\$801	\$452
Pro no DLL	58%	55%	34%	26%	\$2,723	\$189	\$1,202	\$68

Why: the winning structures use wide stops (about 3 ATR) at 30 to 40 micros, so a single trade can float far below the limit and recover. A closed-balance rule never sees that dip. **Ask Lucid support in writing before sizing up.**

02 Firm rules and zero-edge baselines

What each firm's rules are as modelled, and what random entries achieve by tuning daily rules alone.

Eval rules as modelled (50K accounts)

Firm	Rule file	Target	Max loss (trails)	Trail locks after	Consistency	Min days	Daily loss limit	Max micros	Eval fee
Lucid Flex	lucid-flex-50k@2026-09-27	\$3,000	\$2,000	\$2,100 profit	50% rule	2	none	40	\$100 (assumed)
Pro + DLL	lucid-pro-50k@2026-09-27b	\$3,000	\$2,000	\$2,100 profit	none	1	\$1,200 soft	40	\$115 (from you)
Pro no DLL	lucid-pro-50k-no-dll@2026-09-27b	\$3,000	\$2,000	\$2,100 profit	none	1	none	40	\$140 (from you)
Apex user set	UNCONFIRMED apex-legacy-50k@2026-09-27b	\$3,000	\$2,000	\$2,100 profit	none	1	none	100	\$35 + \$85 act. (assumed)
Apex EOD site	UNCONFIRMED apex-eod-50k@2026-09-27b	\$3,000	\$2,000	\$2,100 profit	none	1	\$1,000 soft	60	\$35 + \$85 act. (assumed)

Max loss trails the highest end-of-day balance until the account is up by the lock level, then freezes at start + \$100. Activation fees are assumed: \$0 at Lucid, \$85 at Apex. Apex EOD copies the Apex Legacy fee. Flatten times: Lucid 4:45 PM ET, Apex 4:59 PM ET (the model flattens by 4:10 PM ET).

Funded (PA) rules as modelled

Variant	Max loss	Size	Payout eligibility	Payout size	Other
Lucid Flex funded	\$2,000 EOD trail, locks at \$50,100	20/30/40 micros at \$0/\$1k/\$2k profit	5 days ≥ \$150 profit, cycle profit > 0	\$500 to \$2,000 (max 50% of profit)	5 payouts, then live
Lucid Flex funded + \$1,200 daily limit (assumed)	same	same	same	same	daily limit stops the day only (value assumed)
Pro + DLL funded	same trail	40 micros, no scaling	cycle profit ≥ \$500, biggest day ≤ 40%, balance ≥ \$52,100 after payout	\$500 to \$2,000, then \$2,500	\$1,200 soft daily limit
Pro no DLL funded	same	same	same	same	no daily limit
Apex user set UNCONFIRMED funded PA	\$2,500 intraday trail incl. open P&L, stops at \$50,100	half size until \$52,600	8 days (5 ≥ \$50), biggest day ≤ 30%, safety net \$52,600	\$500 to \$2,000 (payouts 1 to 5)	30% open-loss rule (about \$750), no OCO or both-side orders, stop ≤ 5× target

Lucid funded split is 90/10. Apex splits 100% of the first \$25k. Source: your funded-rules paste and the firms' help pages (rules_research.md, retrieved 2026-09-30).

Apex: two rule sets, both unconfirmed

Your set (“Legacy” label, \$2,000 end-of-day trail, \$3,000 target, 100 micros) is a hybrid. On the firm's own pages, *Legacy* is a \$2,500 **intraday**-trailing product, and the separate end-of-day family (site set: \$2,000, \$1,000 soft daily limit, 60 micros) is also enforced in real time on open P&L. Both sets are scored and flagged UNCONFIRMED. Apex PA also forbids OCO or both-side orders, stops more than 5× the target and using the trail as a stop, so fast-pass coin-flip structures are not usable there.

Zero-edge baselines: the same search run on random entries

Random-entry configs went through the identical rules search and breach models, so these are the best a strategy with no edge can reach by tuning daily rules alone. If a real result sits near the zero-edge maximum, the rules are doing the work.

03 Firm comparison

Speed, bust risk, cost per funded account, funded payout and value per eval purchase, side by side.

One recommended setup per firm. Headline value is the **same-config** line: the strategy that passes the eval must be the same one that gets paid when funded. The grey text under that value names the strategy (it can differ from the recommended setup in the earlier columns).

Value per purchase = P(pass in 5 days) × E\$ to you within 60 funded days – eval fee – P(pass) × activation. “Mixed” pairs the best eval and best funded configs (they differ): an upper bound. No holdout value: the frozen eval and funded finalists are different configs. Apex EOD has no funded model.

04 Leaderboard

Best searched configs per firm, with the evidence flags that matter.

Top three per firm by P(pass in 5 days), one row per family grid and session. **Lift** is P5 minus the day-matched random control; below the zero-edge p95 it is a warning that the daily rules, not the signal, produce the pass rate.

05 Breakdowns

Which families, timeframes, sessions and exit styles carry the pass rate.

► What each family does

Best P(pass in 5 days) among all searched configs in each family, timeframe, session or exit type (primary breach model; shade = value). A best near the zero-edge maximum in section 2 says little about the signal.

06 Correlation of finalist members

Do the strategies in a portfolio win and lose on the same days?

Correlation of the daily P&L of each finalist portfolio member (in-sample). Near zero means the members win and lose on different days; they still lose together on some bad days.

07 Portfolio vs single, and multiple accounts

More strategies in one account, or more accounts?

Executed-share finding. Under the shared daily rules (for example “max 1 trade a day” or an early take/lock), later-session members often never get to trade, so the “portfolio” is really one strategy. Portfolios were therefore scored on executed P&L, not stand-alone P&L, and the dependable diversifier is several accounts, not several strategies in one account.

Mixes are greedy in-sample fillings, so the in-sample column is optimistic. The pass events of different accounts are only weakly correlated, which is why N helps. Cost is eval fees only (fees assumed).

NQ (E-MINI NASDAQ-100)

Does adding strategies to one account help?

Firm	Build	Members	P5 in-sample [CI]	Bust ≤ 5d	Lift vs random	Top member's share of executed trades	P5 holdout
Lucid Flex	Single	1	69% [64%, 74%]	31%	+0.09	100%	78%
	Portfolio (3+)	3	69% [64%, 74%]	31%	+0.13	71%	78%
Pro + DLL	Single	1	45% [40%, 50%]	54%	+0.09	100%	28%
	Portfolio (3+)	4	42% [38%, 46%]	56%	+0.04	81%	34%
Pro no DLL	Single	1	71% [67%, 74%]	29%	+0.07	100%	81%
	Portfolio (3+)	3	71% [67%, 74%]	29%	+0.09	100%	81%
Apex user set UNCONFIRMED	Single NON-COMPLIANT	1	42% [36%, 48%]	52%	+0.06	100%	30%
	Portfolio (3+) NON-COMPLIANT	4	40% [36%, 44%]	58%	+0.05	100%	31%
Apex EOD site UNCONFIRMED	Single	1	40% [34%, 46%]	54%	+0.08	100%	35%
	Portfolio (3+) NON-COMPLIANT	3	42% [37%, 47%]	58%	+0.07	51%	33%

Apex user set, Apex EOD site: the Single row is the portfolio search's own single, which is not the recommended eval setup in section 1 (that one was chosen among Apex-compliant configs), so its numbers differ from sections 1 and 3. NON-COMPLIANT = the setup breaks an Apex PA rule (a day-stop of \$2,000 or more acts as a trailing threshold; no target or stop over 5× the target).

Members that ran under 5% of the trades: Pro + DLL: 2 of 4 members; Pro no DLL: 2 of 3 members; Apex user set: 3 of 4 members.

08 Pass vs risk

What changes when the position size is cut or raised.

Lucid Flex Pro + DLL Pro no DLL Apex user set Apex EOD site

Same strategy and daily rules, every position scaled to 0.25x up to 1.25x of the recommended size (capped at the firm's contract limit). More size means a faster target but a faster bust.

NQ (E-MINI NASDAQ-100)

Firm	0.25x	0.5x	0.75x	1x	1.25x
Lucid Flex	40% (47%)	51% (48%)	60% (40%)	69% (31%)	69% (31%)

09 Day 1 to 5

On which day attempts end, pass or bust.

When attempts end. Each cell is the share of all start days that pass or bust **on** that day (in-sample; bar drawn to scale, full cell = 100%). Small grey figure after the slash = 2025+ holdout. The rest are still open or end the 5-day window flat.

Lucid Flex cannot pass before day 2 (50% consistency, 2-day minimum), in practice day 3. Fast passes come with fast busts: where an account can pass on day 1 or 3, most busts also land on day 1 or 2. These are short, high-variance bets.

10 News vs non-news

Does a CPI, jobs or FOMC day in the window change the outcome?

An attempt counts as a “news” attempt if a CPI, jobs or FOMC day falls inside its 5-day window (425 news vs 396 non-news start days in-sample, both markets).

Differences of a few points are noise from overlapping start days.

11 Funded accounts

Payout odds, size and speed once an eval is passed.

Objective: a high payout rate, a high payout and a short time to payout. **E\$40** = expected dollars to you within 40 funded trading days (after the 90/10 split, counting accounts that bust before any payout).

First cheque is the gross amount of the first payout. Payout policy = when to request: as soon as the cheque reaches that amount, or at the maximum.

E\$40 is the primary ranking number, taken at a stable rule cell (the lower of the cell's own value and the median of its neighbours), so a #2 row can show a slightly higher raw E\$40 than #1. Apex PA numbers use the pessimistic open-loss ordering and are UNCONFIRMED.

12 Homebase walk-forwards

Fifteen parameter walk-forwards per market on the tester: is there a positive expectancy?

Profit factor = gross profit / gross loss (above 1 is net positive after costs). Evals can be passed without a positive expectancy; funded accounts need one, so lean on the positive rows.

NQ (E-MINI NASDAQ-100)

The tester's walk-forward: parameters picked on one month by t-statistic, tested on the next three months, stitched out-of-sample, raw P&L at 1 NQ with real costs. **6 of 15** are positive. Sum +\$26,545, median -\$5,229. Bars are drawn to scale against the largest absolute result.

13 Notes for the GC run

Lessons from this run and the learnings note: what to reuse, what to skip, limits and timing, and the open rule question.

Reuse

- Run the tester at 1 contract with all sessions on, then split by session and apply size and daily rules offline. One run serves millions of rule sets exactly.
- A day-matched random control (same days, sessions, trade counts, exits and rules) plus a zero-edge null built from random configs run through the same search. Trade-count-only controls overstate edge.
- Report every breach model (end-of-day, realised, intraday). The choice moves some results from 70% to near zero.
- Freeze a holdout manifest with file and code hashes before opening 2025+, score once, then re-derive independently. NQ: zero mismatches across all finalists.
- Independent verify agents found two real bugs this run: a walk-forward look-ahead through a full-window guard, and a Pro daily-limit flag that stayed off. Truncation-test every walk-forward.
- Parallel evals on distinct strategies (not in-account portfolios) as the diversifier.

Skip

- In-account portfolios: members add 0 to +3 points and under a one-trade-a-day rule later members never trade.
- Asia as a session: the tester's windows are calendar-day, so only 00:00 to 03:00 ET is reachable.
- Fast-pass coin-flips at Apex: banned structures, and the open-loss (MAE) rule puts 72 to 85% of trades at the \$750 floor on ES.

Caps and timing

- Tester caps per pilot: 400 screening runs, 3,000 heat-map cells, 15 walk-forwards. NQ used 289 / 1,484 / 15; ES 116 / 932 / 15.
- Two tester slots during desk hours (08:00 to 16:15 ET weekdays), four otherwise. Nothing starts 09:20 to 09:35 ET; offline multiprocessing pauses 09:18 to 09:36.
- Cost per run: NQ 23 s, ES 41 s for the full 2021-09 to 2024 window; a 20-cell heat-map 244 s (NQ), 320 s (ES). Build the tape cache first (ES: about 97 s).
- Keep the Mac on AC with the lid open; hibernation cost about 8.5 hours on the NQ run.
- Rescale points-mode stop grids by the instrument's point size (ES points are about 4x smaller than NQ) and recompute costs per contract (ES \$29 vs NQ \$14 round trip at one contract).
- For GC check first: tick value (\$10 per 0.10 on GC), the micro (MGC) and its commission, roll dates, nearly 24-hour sessions, and the news calendar.

The breach-rule question

Every Lucid result depends on one unconfirmed fact. On NQ the Lucid Flex setup passes about 78% of holdout attempts if closed balance counts and 2.1% if open losses count. Ask in writing and keep the answer next to the sim:

On a LucidFlex or LucidPro 50K account, if a position's unrealised loss takes account equity down to the Max Loss Limit intraday but the trade recovers and closes above it, is the account breached? Is the MLL tested against closed (realised) balance only, or against live equity including open P&L? At what time is the end-of-day balance that sets the trail taken?

- LucidPro with the \$1,200 daily limit: it fails the 60% test on NQ and ES, but it is the one least sensitive to the breach-rule question.
- Families the learnings note marks dead on NQ (thin or negative at the screen): mid_fade, gap, pinbar, sweep_rev. Section 5 still shows high pass rates for gap and sweep_rev because a pass rate does not need a positive net.

14 Final code and parameters

Full parameter sets and strategy source for every finalist.

Everything needed to rebuild each finalist. Each draft's tester id is `draft_<stem>` and its file is `~/ .homebase/strategies/<stem>.py` (NQ stems are `pp_<family>`, ES stems `pp_es_<family>`).
Tester inputs are the timeframe, `sess=all` (the session is split offline), and the stop, target and family parameters below. Sizes and daily rules are applied offline and set in the desk's account rules.
